

**Questions:**

- Will this work?
- What sort of Cisco Switch will be needed to manage the VLANs?
- Is it ok to have Hubs between the Cisco Switch and the offices? The hubs are only needed to create more ports to plug into for each building. What should be used here?
- Is it ok to have the IP phones on their own VLAN?
- Is splitting up the VLANs by MAC addresses the way to go?
- If an office decided to install its own SBS server how will this affect everything? Would it be possible for an office to install their own router and put that on a separate VLAN. They can then plug into their own router as they please.
